BASIC-ABSTRACT:

Where fruit and berry purees and juices with pulp are dried by prefreezing with subsequent crushing and sublimation of the ice, the drying is done in a dense layer of crushed material with loose specific gravity 550-750 kg/cu.m. This intensifies the process. The material is placed in the bath in liq or paste state. Over the bath is a cooled cylinder partially immersed in the material being dried. As the cylinder moves relative to the bath, a layer of material is continuously being applied to the cylinder, which is turned into ice by the cooling of the cylinder. The frozen product, sliced into flakes with loose specific gravity 550-750 kg/aq. cm is scraped from the cylinder by a special knife. The material is then dried in a layer by contact heating.
